

Report

Project Name:	IoT Based Smart Crop Protection System for Agriculture
Team ID:	PNT2022TMID38376
A.Arul Prakasam(Team Leader)	412719106003
J.R.Balaji(Team Member)	412719106004
R.Ragul(Team Member)	412719106013
N.Sriram(Team Member)	412719106301
N.R.Vaitheshwaran(Team Member)	412719106015

Project overview

- The device will detect the animals and birds using the Clarifai service.
- If any animal or bird is detected the image will be captured and stored in the IBM Cloud object storage.
- It also generates an alarm and avoid animals from destroying the crop .
- The image URL will be stored in the IBM Cloudant DB service.
- The device will also monitor the soil moisture levels, temperature, and humidity values and send them to the IBM IoT Platform.
- The image will be retrieved from Object storage and displayed in the web application.
- A web application is developed to visualize the soil moisture, temperature, and humidity values .
- Users can also control the motors through web application.

LITERATURE SURVEY

Digital agriculture, sometimes known as smart farming or e-agriculture is tools that digitally collect, store, analyze, and share electronic data and information in agriculture. Smart agriculture is a broad term that collects agriculture and food production practices powered by Internet of Things, big data and advanced analytics technology. When we talk about IoT, we generally refer to adding sensing, automation and analytics technology to modern agricultural processes. By using this methods we get more efficient, more quality, less resources consumption than compared to regular agriculture

Book/journal	Author's name	explanation
ICT for Agriculture and Environment,CITAMA 2019	Tanya Recalde, Karina Real-Aviles, Cesar Moran, Paola Grijalva, Raquel Gomez chabla	The objective of this paper is to offer an overview of the IoT applications in agriculture through topics such IoT-based software applications for agriculture available in the market, IoT-based devices used in the agriculture, as well as the benefits provided by this kind of technologies.
Internet of Things (IoT)-Based Wireless Health: Enabling Technologies and Applications	Yousaf Bin Zikria, Tariq Umer, Adnan Abid, Shamyla Riaz, Muhammad Shoaib Farooq	The objective of this paper is the collection of all relevant research on IoT agricultural applications, sensors/devices, communication protocols, and network types. Furthermore, it also discusses the main issues and challenges that are being investigated in the field of agriculture

Problem Statement Definition

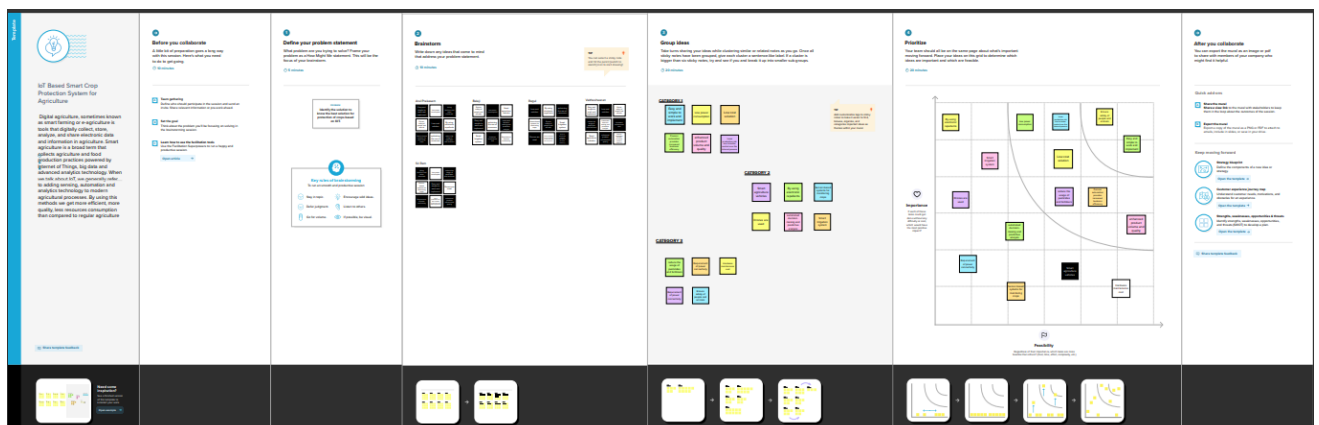

Most of the farmers are facing many problems nowadays due to many reasons. Our problem to solve is the invasion of various species such as birds and animals that harm the crops that are being cultivated. Various types of species such as birds and animals come to the cultivation field according to the crop that is being cultivated and also according to the season of cultivation. Some wild animals enter the field during night times when the field is near a forest region or when the farm cultivates some fruits and other crops that attract animals

Problem Statement (PS)	I am (Customer)	I'm trying to	But	Because	Which makes me feel
PS-1	A farmer	Protect crops	Is difficult	The field is destroyed by animals	Angry
PS-2	A farmer	Protect crops	Is not convenience	Need to be at field at any time	Frustrated
PS- 3	A farmer	Protect safety of animals and others	Is difficult	Of placing of fences to protect crops	Sympathy
PS- 4	A farmer	Protect crops	Is difficult	Less amount of crops is harvested	Angry

Empathy Map Canvas

Brainstorming:

Proposed Solution:

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	Agriculture was the key development in the rise of sedentary human civilization, whereby farming of domesticated species created food surpluses that enabled people to live in cities. But there are many problems occurring during agriculture one of them is animals most of animals near forest and villages depend on farm crops during summer and winter to solve this problem smart agriculture is adopted nowadays. Smart agriculture is a broad term that collects ag and food production practices powered by Internet of Things, big data and advanced analytics technology. When we talk about IoT, we generally refer to adding sensing, automation and analytics technology to modern agricultural processes.
2.	Idea / Solution description	Smart agriculture is one of the best approaches to increase production for competing with the increasing population of our country. Smart Agriculture helps to increase the production of different crops by transforming or reorienting agricultural systems. Since it is also known as precision agriculture which helps to maintain the production of food using minimal resources such as fertilizer, water and seeds irrespective of climate change to protect crops from harm.
3.	Novelty / Uniqueness	With the presence of high-quality sensors in the system which supports Real-time monitoring of agricultural systems even in isolated locations which in turn in controlling or monitoring the use of resources in large proportions, also helps in reducing impacts on the environmental system.
4.	Social Impact / Customer Satisfaction	The result from this smart farming process is – high precision and 24/7 control, eventually leading to considerable savings in all key resources used – water, energy, fertilizers, time spent by strategic people, time spent by lower-qualification human resources. Customers using Smart agriculture solution on their farms can save up to 50% in energy consumed. They also report up to 40% increase in crop yield, while reducing the cost of fertilization and chemical treatment, and up to 60% less losses resulting from animals.
5.	Business Model (Revenue Model)	Many farmers have already begun implementing this technique of smart agriculture for improving their efficiency. Sensors installed in the fields can be used to obtain detailed information for the presence of acidity and rapid increase in the temperature of the soil. Farmers with the use of sensors can also get access to know weather patterns or climatic forecasts remotely. Nowadays many farmers are using this technique of smart agriculture in their lands to avoid over-irrigation and to maintain soil erosion to a large extent. Overall the system is cheaper, easy to use, and efficient than other automation systems.

Solution Fit:

Project Title: IOT Based Smart Crop Protection System For Agriculture

Project Design Phase-I - Solution Fit

Team ID: PNT2022TMD38376

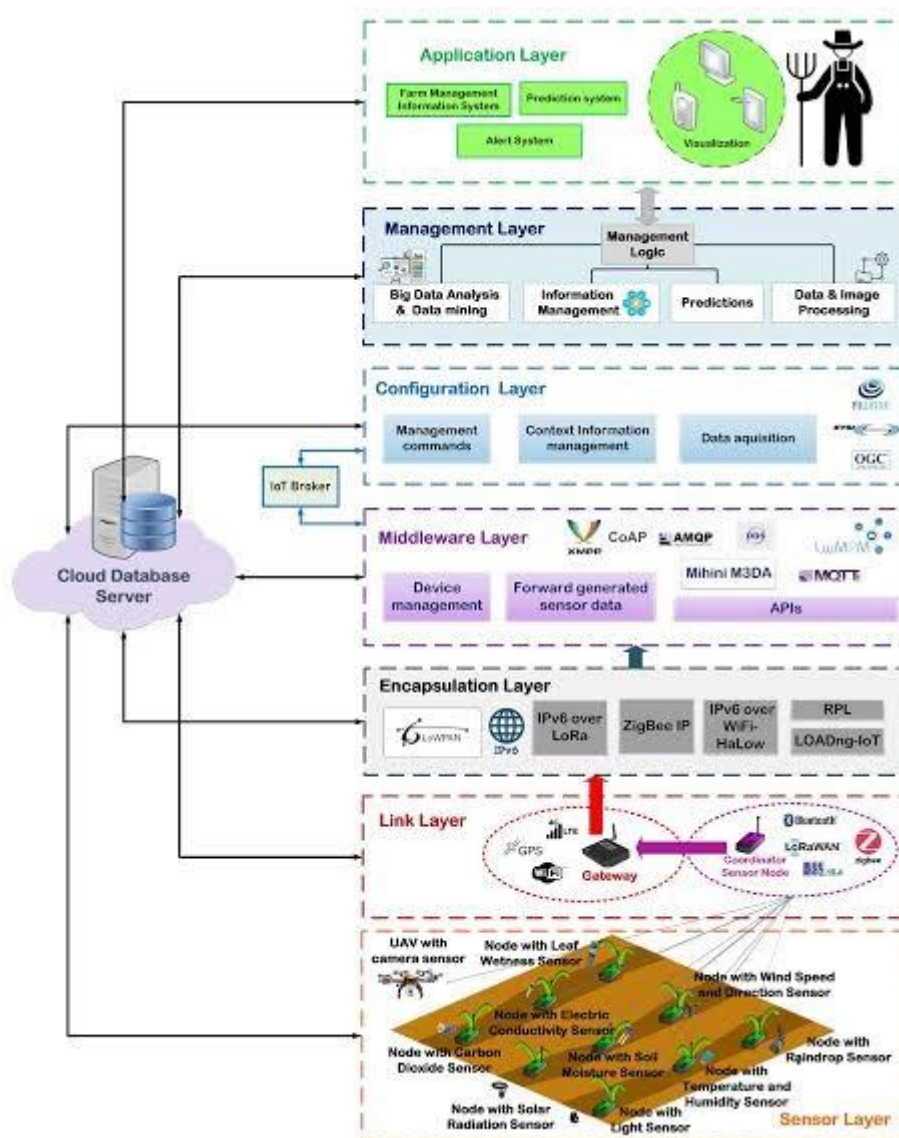

Define CS, it into CC	1. CUSTOMER SEGMENT(S) Farmers who want to protect their crops from animals without hurting them	6. CUSTOMER CONSTRAINTS constraints prevent the customers from taking action or limit their choices	5. AVAILABLE SOLUTIONS Before the farmers had losses and injury due to the spoiling of crops after solution is adopted They spend their most time to enjoy and happy than equipping or watching crops.
	2. JOBS TO BE DONE / PROBLEMS Identify and evaluate risks posed by wild and domestic animals. Consider some methods to prevent animal entry through the use of fences, noise cannons, or other deterrents. Reduce or eliminate animal attractions like standing water, cull piles, and nesting areas. Monitor and document animal activity on the farm. Conduct field assessments before harvest	9. PROBLEM ROOT CAUSE The root cause for the problem is to To protect the crops from heavy rain fall and increase the yield. Generation of power. To protect crops To make the farming easy and efficient	7. BEHAVIOUR By Smoking to prevent animals Fish or garlic natural emulsion; Buckley fencing; Electric fences

3. TRIGGERS Farmers who want to protect their crops from animals without hurting them	10. YOUR SOLUTION Based on the problems occurred to protect crops the RPT Smart Crop Protection System for Agriculture is used to protect crops from animals without affecting them.	8. CHANNELS of BEHAVIOUR 1.1) ONLINE Using pesticides Biological pest control Baiter based approaches such as Agro- Tenticles 1.2) OFFLINE plant breeding and genetic modification Using Fences Using Noise baiter Using Shield to prevent the animals
--	---	---

Data flow and Solution Architecture:

Solution architecture is a complex process – with many sub-processes – that bridges the gap between business problems and technology solutions. Its goals are to :

- Find the best tech solution to solve existing business problems.
- Describe the structure, characteristics, behaviour, and other aspects of the software to project stakeholders.
- Define features, development phases, and solution requirements.
- Provide specifications according to which the solution is defined, managed, and delivered.

Customer experience journey map

Use this framework to better understand customer needs, motivations, and obstacles by illustrating a key scenario or process from start to finish. When possible, use this map to document and summarize interviews and observations with real people rather than relying on your hunches or assumptions.

APPLICATIONS:

- Monitoring the crop field with the help of sensors (light , humidity, temperature, soil moisture, etc.)
- Automating the irrigation system
- Soil Moisture Monitoring (including conductivity)

CONCLUSION:

The problem of crop vandalization by wild animals and fire has become a major social problem in current time. It requires urgent attention as no effective solution exists till date for this problem. Thus, this project carries a great social relevance as it aims to address this problem. This project will help farmers in protecting their orchards and fields and save them from significant financial losses and will save them from the unproductive efforts that they endure for the protection their fields. This will also help them in achieving better crop yields thus leading to their economic well being.
